I learned how to use Retrofit by going through several beginner-friendly tutorials and official documentation. The Retrofit Tutorial on daily.dev was really helpful in showing me how to set up the library and make API requests. I also referred to the official Retrofit docs to understand how to handle JSON responses and integrate it with Kotlin coroutines. The GeeksforGeeks guide gave me a clear step-by-step example of how to use Retrofit with coroutines, which I applied directly in my app. Finally, the Android Developers Codelab helped me connect everything together in a real Compose project. These resources made it much easier to fetch fun facts in my app and strengthened my understanding of networking in Android.
